

websense[®]

ESSENTIAL INFORMATION PROTECTION™

Websense was founded by Phil Trubey in 1994. It went public in the year 2000.

Apart from [Web](#) filtering, also known as [Internet content-control software](#), the company provides email security, and data loss-prevention technology. The software also tracks individual internet usage, and its reports can be [data drilled](#) by "risk class, category, URL, application, user, workstation, dates, and more.

Websense allows system administrators to block access to web sites and other protocols based on categories. These contain lists of sites that may be blocked at will, either at specified times or permanently. The software offers clients a *continue button* which permits users to access an otherwise blocked category if it is work related.

Policies can be produced that control either previously identified information that contains 'tags' such as account numbers, credit card records or any combination of many variables. A score is assigned based on a pre-defined set of rules and an action applied. The process can be entirely automated but relies upon either preset policy templates or bespoke rule sets that are developed in house.

The policies or rules that are applied, define what happens at every stage, like most processes the quality of the output depend on the quality of the input. Getting the policies right is critical. Traditional Information Security processes such as Risk Assessments and Information Asset Registers are important as they provide the information needed to create policies that work for particular situations. Although good policy templates are free out of the box, getting the most from them takes some tuning

PRODUCTS OVERVIEW

Websense TRITON™

The Best Security for Modern Threats at the Lowest Total Cost of Ownership

Websense® TRITON™ is the first and only solution to combine industry-leading [Web security](#), [email security](#), and [data loss prevention security](#) technologies into one unified architecture. The TRITON solution delivers increased content security and cost savings helping organizations achieve a significant return on their security investments while enabling them to leverage all the benefits of Web 2.0 — unlike point solutions that rely on redundant multi-vendor management tools. Compared with such limited and restrictive solutions, the TRITON architecture also enables superior control and flexibility providing unrivaled visibility into an organization's security operations and protects remote offices and mobile workers just as effectively as at corporate headquarters.

TRITON provides exceptional content security by:

- Enabling the safe use of the Web as an application platform while protecting organizations in real time from blended and emerging threats no matter where their employees reside, as well as protecting organizations from inappropriate content and confidential data loss.
- Preventing dynamic inbound Internet threats, controlling unauthorized content, ensuring productivity, and effectively stopping outbound data loss through Websense TruContent™ intelligence, the first and only system that unifies content visibility and analysis all the way to the data level, as it flows in and out of an organization.
- Improving regulatory compliance to monitor and report on compliance across [multiple industries](#) from health care and retail to finance and government more effectively and comprehensively.

TRITON lowers total cost of ownership by:

- Streamlining content security appliance infrastructure and using Security-as-a-Service (SaaS) to reduce cost and complexity while extending coverage and visibility.
- Delivering the flexibility to choose a single platform or to implement a mix that best suits an organization's needs with Websense TruHybrid™ deployment, the industry's first and only security platform that reaches across the global enterprise, unifying deployment of high-performance [appliances](#) at a corporate headquarters with [SaaS](#) at branch and remote offices.
- Providing efficiencies through its single interface and unified policy management for on-premise and cloud-based deployment spanning [Web security](#), [email security](#), and [data loss prevention](#) and providing greater visibility, control, and management capabilities.

PLATFORM

The Websense Deployment Platform

Content Security Deployed How and Where You Need It

Websense provides integrated options for deploying our industry-leading content security for Web, email, and data. Deploy the platform or mix of platforms that best fits the needs of your organization. Our flexible approach enables organizations of every size and degree of complexity to protect their essential information with the lowest total cost of ownership.

Which platform is right for you?			
Platforms	<u>Web Security</u>	<u>Email Security</u>	<u>Data Security</u>
<u>V-Series Appliances</u>	✓	✓	✓
<u>Security-as-a-Service (SaaS)</u>	✓	✓	
<u>Software</u>	✓	✓	✓

Technologies

Web, Data, and Email Security

Websense® Essential Information Protection™ is based on best-in-class products, technologies, and Security-as-a-Service (SaaS) solutions that provide integrated network security threat defense and powerful policy-based control over your organization's sensitive data.

Websense is unique in the industry in letting you control all the critical elements of Web, data, and email security, including:

- Who is authorized to access specific websites, sensitive content, or applications.
- What data is critically important to your organization and must be protected from accidental or intentional leaks.
- How you allow sensitive data to be communicated, and how online resources can be used safely and productively by your business.

- Where you allow users to go online, and where sensitive data can be sent safely.

[The Websense ThreatSeeker Network](#) delivers real-time reputation analysis and expanded behavioral analysis, giving users the most up-to-date protection possible from unwanted content and malicious network security threats.

[Websense Advanced Classification Engine \(ACE\)](#) is an advanced composite content classification engine embedded in Websense solutions and is part of the Websense TRITON™ solution. ACE is powered by the ThreatSeeker Network and includes technologies such as Websense PreciseID™, real-time security and content classification, antispam, reputation services, URL filtering, and antivirus. It surpasses legacy, point-based security technologies in both accuracy and coverage by correlating multiple analytic services to identify security threats that might otherwise circumvent any single mechanism. When combined, these technologies eliminate gaps in coverage, provide layered protection, and deliver unparalleled accuracy.

[Defensio™](#) Web service provides adaptive and accurate protection from comment spam, malware, and other threats embedded in blogs, forums, and other Web 2.0 sites that support user-generated content. Delivered via the Websense global SaaS platform, Defensio technology also provides invaluable Web 2.0 threat intelligence that increases the accuracy and effectiveness of the entire portfolio of Websense Web, email, and data security products.
